

Checkout Incident Detection Agent

A two-agent n8n pipeline that triages checkout events against deterministic rules and a failure baseline — publishing exactly one ALERT-or-LOG command per run.

n8n Cloud

Google Gemini

Google Sheets

Slack API

The Problem

Checkout volume is too high to triage by hand — especially payment failures.

1

Volume

Hundreds of checkout events can arrive per hour — manual review doesn't scale.

2

Revenue risk

Payment-step failures carry the highest cost; they need to surface fastest, every time.

3

Scope boundary

The agent decides and publishes intent (ALERT or LOG) — it never executes a fix itself.

Original brief named Zapier; built on n8n Cloud instead — native Code nodes for the deterministic rules, a free hosted LLM node for the one place judgment is genuinely needed.

System Flow

Agent 1 (webhook, real-time) → shared 4-tab Google Sheet → Agent 2 (schedule, every 15 min)

Checkout Incident Detection — Two-Agent n8n Pipeline

Agent 1 ingests events in real time · Agent 2 triages on a 15-minute schedule · both share one 4-tab Google Sheet

Key Decisions & Trade-offs

1 Code decides, LLM explains

Severity/action come from a deterministic Code node (PAYMENT step, value threshold, baseline overrun, mobile pattern). Gemini writes only the one-sentence reason — the decision stays reproducible and testable.

2 Schedule, not real-time

Agent 2 batches on a 15-minute trigger rather than firing per event — stays inside free-tier LLM rate limits and keeps the logic simple; a same-instance chain call could remove the lag later.

3 Tested with broken input, not just clean presets

curl scenarios, then a self-built HTML console, deliberately included an invalid payload — that's what surfaced real bugs (see next slide).

4 Known gap vs. spec

The brief calls a downstream webhook broadcast mandatory; this build hands off via a Slack post and does not include an outbound HTTP Request node.

Confirmed on a Live Run

Actual captured execution — not a mockup

LOG — LOW severity

Step: N/A · Cart value: 0 · Device: N/A

Reason: No new checkout events to process

Timestamp: 2026-08-13 08:02:26

Automated with this n8n workflow

ALERT — HIGH severity

Step: SHIPPING · Cart value: 135672 · Device: MOBILE

Reason: The SHIPPING step is rated HIGH severity because the cart value of 135672 exceeds the threshold of 1500.

Timestamp: 2026-08-13 08:43:49

Automated with this n8n workflow

"The SHIPPING step is rated HIGH severity because the cart value of 135,672 exceeds the threshold of 1500."

checkout_step	SHIPPING
cart_value	135,672
device	MOBILE
baseline_rate	5.6
severity / action	HIGH / ALERT

Same data appears in the Google Sheet row, the n8n execution log, and the Slack message shown at left.
