

Hands-On Problem Statement

Building a Grounded, Retrieval-Augmented Metrics Intelligence Agent on N8N

Background

NovaCart's leadership team relies on weekly operational metrics (e.g., revenue, conversion rates, churn, SLA compliance) stored across **various internal knowledge documents** (Drive, Notion, Confluence). Today, insights are generated manually, leading to delays, inconsistencies, and ungrounded AI summaries that cannot be trusted.

You have been asked to design and implement an **automated AI workflow in N8N** that answers leadership questions **only using verified internal sources**, explains anomalies, and produces a concise, citation-backed email report.

Data Sources

- [NovaCart Company Annual Report 2024.docx](#)
- [NovaCart Product Catalog.pdf](#)
- [SKU Weekly Sales Conversion 3Y with Revenue.docx](#)

Objective:

Build a **Retrieval-Augmented Generation (RAG) workflow** that:

1. Ingests metrics and documentation from multiple sources
2. Embeds and indexes content for semantic retrieval
3. Responds to user queries with **grounded, source-cited answers only**

This solution will explicitly demonstrate **why RAG outperforms prompt-only approaches** for enterprise metrics analysis.
