The Problem

Product-health data lives in three disconnected places

User Feedback

NPS, app reviews, interviews —
owned by no single dashboard

Support Tickets

Volume, CSAT, churn risk — lives
in the support tool

Product Metrics

DAU, MRR, conversion — lives in
the analytics stack

A PM asking a spoken question shouldn't need to know which dashboard owns the answer — and a single do-everything prompt risks scope-bleed between domains.

Brief: build workflow orchestration that routes to scoped specialist agents based on intent.

TaskFlow Product Health Monitor — Agent Workflow

ElevenLabs Agent Workflow · Start → Greeter → 3 Specialists → End · 12 routing conditions

Key Decisions & Trade-offs

1

Router-only Greeter

The Greeter is explicitly forbidden from answering data questions — trade-off: one extra hop, but zero risk of a generalist front door blurring domain boundaries.

2

One KB file per specialist

Each subagent's KB attachment is restricted to exactly one file — a structural guarantee, not just a prompt instruction, against cross-contamination.

3

LLM-condition routing

Natural-language routing conditions instead of rigid keyword/DTMF menus — trades some determinism for a natural voice experience.

4

Bidirectional cross-routing

Each specialist pair shares one edge with forward + backward conditions, letting callers pivot topic mid-conversation without restarting at the Greeter.
