

Ecommerce Negative Review Agent

A no-code Zapier AI agent that reads customer reviews, classifies sentiment, and drafts an empathetic reply only for the reviews that need one.

Problem

Support teams must triage every incoming review, but missing a negative one hurts trust — and manual triage doesn't scale. A slow or generic reply to a frustrated customer can be nearly as costly as no reply at all.

Approach & Key Decisions

- Zapier Agents (no-code, LLM-backed) chosen over a custom-coded pipeline — faster to build, but logic changes go through prompt edits, not version-controlled code.
- LLM-driven system prompt chosen over a rule-based keyword classifier, since it can classify *and* draft a context-aware reply in one step.
- Guardrails iterated through testing: the anti-hallucination rule was broadened from "don't rewrite the review" to "don't hallucinate details, customers, actions, or reviews" after testing showed the narrower rule wasn't enough.
- Trigger started On Demand for testing, then moved to an hourly schedule once verified.
- Deliberate scope cut: the agent drafts replies but never sends them — Gmail is a prerequisite for a human send step, not a connected tool.

What It Does

- Reads every row from a Google Sheet (Review + Mail Draft columns).
- Treats an empty Mail Draft cell as an unprocessed review; already-answered rows are left alone.
- Classifies sentiment directly from the review text.
- Negative → drafts a specific, empathetic reply. Positive/Neutral → writes "No response required."
- Writes the result back to the sheet via Zapier's Google Sheets tools.

Results & Learnings

On the rows already processed in this sheet snapshot, the agent matched sentiment to the correct action every time. A third negative review remained queued with an empty Mail Draft cell — a real illustration of the agent's idempotent, empty-cell-only logic. The main lesson: prompt-only guardrails need real iteration to hold up; the no-code approach traded automated testing for build speed and easy hand-off.

Tech Stack

Component	Role
Zapier Agents (beta)	LLM-backed no-code runtime; hosts the system prompt
Google Sheets	Data source + destination, via Get Many Rows / Update Row tools
Gmail	Prerequisite for the human send step (not a connected tool)
Zapier Scheduler	Runs the agent hourly in production
